BUYERS GUIDE 2015

Protect What Is Most Precious

CODAN infection prevention sets are designed to effectively reduce CLABSI risks in the NICU and PICU.

Specialty neonate/pediatric sets are fully customizable to specific customer needs. We offer completely sterile burettes for truly sterile procedures. Eliminate the need to assemble multiple sets and increase efficiencies of line change outs.

- All-In-One Sets
- Decreases CLABSI Rates
- Bifurcated and Trifurcated
- Increased Infection Control
- Microbore & Minibore Tubing
- Complete & Sterile Burette Sets
- 0.2 Micron Air Eliminating Filter
- Needlefree Adapters
- Available to fit all Syringe Pumps
- Latex Free and Non-DEHP Tubing
- Custom Sets available in 4 Weeks
- Meets CDC & FDA Requirements
- Quality Tubing Sets made in the United States

Neonatal nurses have concerns about oxygen toxicity*

Though FiO_2 is necessary and often beneficial at appropriate doses, elevated levels can put patients at risk of hyperoxia and may result in¹⁻⁴:

- Generation of reactive oxygen species
- Cytotoxicity
- Damage to lung tissue

Currently, no published national guidelines exist for hyperoxia management.⁵

Mallinckrodt Pharmaceuticals is working to link the ongoing dialogues around effective use of oxygen supplementation. Look for more information this fall from Mallinckrodt Pharmaceuticals.

*Eighty-six percent of neonatal nurses surveyed at an Ikaria-sponsored symposium entitled Oxygen Toxicity: Hyperoxia and the Risks to the Pulmonary System had concerns about oxygen toxicity.

Human milk makes all the difference

The American Academy of Pediatrics' (AAP) policy recommends the use of human milk for all preterm infants, whether mother's own milk (MOM) or pasteurized donor human milk when mother's own milk is unavailable.¹

Only Prolacta Bioscience, the leader in the science of human milk, provides:

- A full line of human milk-based nutrition for premature infants
- Human milk products that undergo the most rigorous testing and screening in the industry

In term and near-term neonates with hypoxic respiratory failure (HRF)...

When do you stop the cascade?

Early intervention with INOMAX® (nitric oxide) for inhalation upon confirmation of pulmonary hypertension may help:

- Avoid higher levels of supplemental oxygen
- Improve oxygenation¹
- Potentially prevent the progression of HRF²

Learn more at www.inomax.com

Indication

INOMAX® is a vasodilator, which, in conjunction with ventilatory support and other appropriate agents, is indicated for the treatment of term and near-term (>34 weeks) neonates with hypoxic respiratory failure associated with clinical or echocardiographic evidence of pulmonary hypertension, where it improves oxygenation and reduces the need for extracorporeal membrane oxygenation.

Utilize additional therapies to maximize oxygen delivery with validated ventilation systems.

Important Safety Information

- INOMAX is contraindicated in the treatment of neonates known to be dependent on right-to-left shunting of blood.
- Abrupt discontinuation of INOMAX may lead to increasing pulmonary artery pressure and worsening oxygenation even in neonates with no apparent response to nitric oxide for inhalation.
- Methemoglobinemia and NO₂ levels are dose dependent. Nitric oxide donor compounds may have an additive effect with INOMAX on the risk of developing methemoglobinemia. Nitrogen dioxide may cause airway inflammation and damage to lung tissues.
- In patients with pre-existing left ventricular dysfunction, INOMAX may increase pulmonary capillary wedge pressure leading to pulmonary edema.
- Monitor for PaO₂, methemoglobin, and inspired NO₂ during INOMAX administration.
- Use only with an INOmax DS_{IR}®, INOmax® DS, or INOvent® operated by trained personnel.

Please see Brief Summary of Prescribing Information on adjacent page.

INOmax®
(nitric oxide) **FOR INHALATION**

Stop the cascade

INOMAX[®] (nitric oxide) for inhalation

Brief Summary of Prescribing Information

INDICATIONS AND USAGE

Treatment of Hypoxic Respiratory Failure

INOMAX[®] is a vasodilator, which, in conjunction with ventilatory support and other appropriate agents, is indicated for the treatment of term and near-term (>34 weeks) neonates with hypoxic respiratory failure associated with clinical or echocardiographic evidence of pulmonary hypertension, where it improves oxygenation and reduces the need for extracorporeal membrane oxygenation.

Utilize additional therapies to maximize oxygen delivery with validated ventilation systems. In patients with collapsed alveoli, additional therapies might include surfactant and high-frequency oscillatory ventilation.

The safety and effectiveness of INOMAX have been established in a population receiving other therapies for hypoxic respiratory failure, including vasodilators, intravenous fluids, bicarbonate therapy, and mechanical ventilation. Different dose regimens for nitric oxide were used in the clinical studies.

Monitor for PaO₂, methemoglobin, and inspired NO₂ during INOMAX administration.

CONTRAINDICATIONS

INOMAX is contraindicated in the treatment of neonates known to be dependent on right-to-left shunting of blood.

WARNINGS AND PRECAUTIONS

Rebound Pulmonary Hypertension Syndrome following Abrupt Discontinuation

Wean from INOMAX. Abrupt discontinuation of INOMAX may lead to worsening oxygenation and increasing pulmonary artery pressure, i.e., Rebound Pulmonary Hypertension Syndrome. Signs and symptoms of Rebound Pulmonary Hypertension Syndrome include hypoxemia, systemic hypotension, bradycardia, and decreased cardiac output. If Rebound Pulmonary Hypertension occurs, reinstate INOMAX therapy immediately.

Hypoxemia from Methemoglobinemia

Nitric oxide combines with hemoglobin to form methemoglobin, which does not transport oxygen. Methemoglobin levels increase with the dose of INOMAX; it can take 8 hours or more before steady-state methemoglobin levels are attained. Monitor methemoglobin and adjust the dose of INOMAX to optimize oxygenation.

If methemoglobin levels do not resolve with decrease in dose or discontinuation of INOMAX, additional therapy may be warranted to treat methemoglobinemia.

Airway Injury from Nitrogen Dioxide

Nitrogen dioxide (NO₂) forms in gas mixtures containing NO and O₂. Nitrogen dioxide may cause airway inflammation and damage to lung tissues. If the concentration of NO₂ in the breathing circuit exceeds 0.5 ppm, decrease the dose of INOMAX.

If there is an unexpected change in NO₂ concentration, when measured in the breathing circuit, then the delivery system should be assessed in accordance with the Nitric Oxide Delivery System O&M Manual troubleshooting section, and the NO₂ analyzer should be recalibrated. The dose of INOMAX and/or FiO₂ should be adjusted as appropriate.

Heart Failure

Patients with left ventricular dysfunction treated with INOMAX may experience pulmonary edema, increased pulmonary capillary wedge pressure, worsening of left ventricular dysfunction, systemic hypotension, bradycardia and cardiac arrest. Discontinue INOMAX while providing symptomatic care.

ADVERSE REACTIONS

Because clinical trials are conducted under widely varying conditions, adverse reaction rates observed in the clinical trials of a drug cannot be directly compared to rates in the clinical trials of another drug and may not reflect the rates observed in practice. The adverse reaction information from the clinical studies does, however, provide a basis for identifying the adverse events that appear to be related to drug use and for approximating rates.

Controlled studies have included 325 patients on INOMAX doses of 5 to 80 ppm and 251 patients on placebo. Total mortality in the pooled trials was 11% on placebo and 9% on INOMAX, a result adequate to exclude INOMAX mortality being more than 40% worse than placebo.

In both the NINOS and CINRGI studies, the duration of hospitalization was similar in INOMAX and placebo-treated groups.

From all controlled studies, at least 6 months of follow-up is available for 278 patients who received INOMAX and 212 patients who received placebo. Among these patients, there was no evidence of an adverse effect of treatment on the need for rehospitalization, special medical services, pulmonary disease, or neurological sequelae.

In the NINOS study, treatment groups were similar with respect to the incidence and severity of intracranial hemorrhage, Grade IV hemorrhage, periventricular leukomalacia, cerebral infarction, seizures requiring anticonvulsant therapy, pulmonary hemorrhage, or gastrointestinal hemorrhage.

In CINRGI, the only adverse reaction (>2% higher incidence on INOMAX than on placebo) was hypotension (14% vs. 11%).

Based upon post-marketing experience, accidental exposure to nitric oxide for inhalation in hospital staff has been associated with chest discomfort, dizziness, dry throat, dyspnea, and headache.

OVERDOSAGE

Overdosage with INOMAX will be manifest by elevations in methemoglobin and pulmonary toxicities associated with inspired NO₂. Elevated NO₂ may cause acute lung injury. Elevations in methemoglobin reduce the oxygen delivery capacity of the circulation. In clinical studies, NO₂ levels >3 ppm or methemoglobin levels >7% were treated by reducing the dose of, or discontinuing, INOMAX.

Methemoglobinemia that does not resolve after reduction or discontinuation of therapy can be treated with intravenous vitamin C, intravenous methylene blue, or blood transfusion, based upon the clinical situation.

DRUG INTERACTIONS

No formal drug-interaction studies have been performed, and a clinically significant interaction with other medications used in the treatment of hypoxic respiratory failure cannot be excluded based on the available data. INOMAX has been administered with dopamine, dobutamine, steroids, surfactant, and high-frequency ventilation. Although there are no study data to evaluate the possibility, nitric oxide donor compounds, including sodium nitroprusside and nitroglycerin, may have an additive effect with INOMAX on the risk of developing methemoglobinemia. An association between prilocaine and an increased risk of methemoglobinemia, particularly in infants, has specifically been described in a literature case report. This risk is present whether the drugs are administered as oral, parenteral, or topical formulations.

MAKE-A-WISH®

Who knows better what ventilatory support a patient needs than the patient? NAVA® (Neurally Adjusted Ventilatory Assist) lets the baby's own physiological signal control the exact timing and amount of assist for every breath. This same signal also provides the clinician insight into the baby's breathing drive for diagnostics and weaning.

Give your neonatal patient the support they need to breathe easier, sleep better and grow stronger with SERVO and NAVA.

Losing sleep over ENFit™?

NeoMed has the answer:

NEOCONNECT®

Where ENFit™ and innovation meet.

Could clinical outcome be impacted by the ENFit™ supplier I choose?

How long does it take EBM to colonize an open cavity of the ENFit™ connector? Do I only have 4 hours before EBM colonizes?

Do some hub designs allow HBM, meds, or fluids to accumulate?

Does my ENFit™ supplier address cleaning to reduce bacteria colonization?

Can I clean the hubs to help protect the baby from bacteria?

What is the clinical impact on a preemie from use of feeding tube that cannot be cleaned?

Can we keep feeding tube protocols or will they need to be changed more often?

Do processes change, do I have to create new protocols?

Does my ENFit™ supplier address small dose accuracy?

PRODUCTS AND SERVICES

Respondents were asked to select categories that applied to their companies. We used previous information for firms that didn't return forms. Also, if companies selected inappropriate or duplicate categories, we made a judgment call on the proper categories. Companies that returned forms have a customized listing of all their product categories in the alphabetical Companies section.

Critical Congenital Heart Defects (CCHD) and Pulse Oximetry Screening

Motion Tolerant. Clinician Tested.

The Covidien Nellcor™ pulse oximetry portfolio facilitates quick, noninvasive screenings for CCHD. Since 1993, Nellcor™ pulse oximetry technology has been utilized on more than 33,000 newborns spanning five separate clinical studies evaluating the use of pulse oximetry as a tool in CCHD screening.

Covidien is the only company to receive FDA clearance for a motion-tolerant bedside pulse oximeter portfolio that is also compliant with ISO 80601-2-61 (International Organization for Standardization) standards for pulse oximetry.
